Mobile Design Blueprint

Goal: mobile-first premium creator studio
Audience: Android and iPhone users
Primary UX: compact app-shell layout with glass cards

Architecture:
- index.html: app shell and semantic layout
- styles.css: modern mobile-first visual system
- app.js: state transitions and local generation logic
- manifest.webmanifest: installable app metadata
- sw.js: offline support and PWA readiness

Workflow:
1. Choose content lane and tone
2. Select a content mode
3. Enter a product or idea prompt
4. Generate local creative suggestions
5. Save results in browser storage
6. Iterate without a backend dependency

Design system:
- gradients and soft glass surfaces
- dark premium palette
- large touch targets
- safe-area aware bottom navigation
- responsive card layout

Recommended next steps:
- add production AI backend
- add save/export/history
- add onboarding and personalization
- ship the app as installable on mobile devices
